Overview

Sets Definitions (4.1–4.1.1)

Sets Operations (4.1.2–4.1.5)

Equality Proofs (4.1.6)

Venn Diagrams

Set Definition

Definition (informal): A *set* is a bunch/collection/group of objects.

Definition: The *elements* of the set are the objects contained in that set.

Sets can contain numbers, ordered sequences of numbers, strings, names, or other sets.

Objects are either *in* the set or *not in* the set. We don't have a concept of an object being in a set multiple times. It's a Boolean property.

We write curly braces around a comma-separated list to build a set.

Examples:

- ▶ $H = \{ \text{Kyran, Morley, Will} \}$
- ▶ $I = \{ \text{Mercury, Venus, Earth, Mars} \}$
- ▶ $\mathbb{N} = \{0, 1, 2, 3, 4, \dots\}$
- ▶ $S = \{ \text{Brown, Columbia, Cornell, } \dots, \text{Yale} \}$

Elements

- ▶ $H = \{ \text{Kyran, Morley, Will} \}$
- ▶ $I = \{ \text{Mercury, Venus, Earth, Mars} \}$
- ▶ $\mathbb{N} = \{0, 1, 2, 3, 4, \dots\}$
- ▶ $S = \{ \text{Brown, Columbia, Cornell, } \dots, \text{Yale} \}$

Definition: We say $x \in S$ if x is *an element of* or *in* or *a member of* the set S .

- ▶ $\text{Morley} \in H$? Yes.
- ▶ $\text{Columbia} \in H$? No. $\text{Columbia} \notin H$.
- ▶ $\text{Columbia} \in S$? Yes.
- ▶ $\text{Dartmouth} \in S$? Yes.

Some Sets of Numbers

- ▶ $\emptyset = \{\}$ (empty set, null set)
- ▶ $\mathbb{N} = \{0, 1, 2, 3, 4, \dots\}$ (non-negative integers)
- ▶ $\mathbb{Z} = \{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$ (integers)
- ▶ $\mathbb{Q} = \{1/2, -4/15, 21, \dots\}$ (rationals)
- ▶ $\mathbb{R} = \{\sqrt{2}, -\pi, 21, \dots\}$ (real numbers)
- ▶ $\mathbb{C} = \{i/2, 15 - i, \sqrt{7}, 21, \dots\}$ (complex numbers)

Superscript plus limits to (strictly!) positive values: $\mathbb{Z}^+ = \mathbb{N}^+$.

Superscript minus limits to negative values: $21 \notin \mathbb{R}^-$.

Sets of sets

- ▶ $A = \{1, 4, 9\}$
- ▶ $B = \{\{1, \{4\}\}, \{9\}\}$
- ▶ $1 \in A$? Yes.
- ▶ $1 \in B$? No, but $\{1, \{4\}\} \in B$.
- ▶ $\exists x \in B, 1 \in x$? Yes, $x = \{1, \{4\}\} \in B$ and $1 \in x$.

Subsets

Definition: One set is a *subset* of another if every element of the first set is also an element of the second.

We write $S \subseteq T$ to say the set S is a subset of set T . So, $S \subseteq T$ means $\forall x \in S, x \in T$. Could also write $\forall x, x \in S \text{ IMPLIES } x \in T$.

Examples:

- ▶ $\mathbb{N} \subseteq \mathbb{Z}$? Yes, every positive integer is also an integer.
- ▶ $\mathbb{Z}^+ \subseteq \mathbb{N}$? Yes, every positive integer is also a non-negative integer.
- ▶ $\mathbb{C} \subseteq \mathbb{Z}$? No, $\mathbb{C} \not\subseteq \mathbb{Z}$. Some (many!) complex numbers are not integers. Although, $\mathbb{Z} \subseteq \mathbb{C}$.
- ▶ $\mathbb{N} \subseteq \mathbb{N}$. Yes, if sets are equal, all of the first must also be in the second!

Note: $\{1, 2, 3\} \subseteq \{1, 2, 3, 4\}$ looks a little bit like $3 \leq 4$.

We write $A \subset B$ to rule out equality (like $a < b$).

Non-Trichotomy

If a and b are integers, exactly one of these properties must hold:

- ▶ $a < b$
- ▶ $a = b$
- ▶ $a > b$

Not so for subsets. Example?

$$A = \{0\}$$

$$B = \{1\}$$

$A \subset B$? No, $0 \in A$, but $0 \notin B$.

$A = B$? No, they are different sets.

$A \supset B$? (superset!) No, $1 \in B$, but $1 \notin A$.

Operations on sets: Union

► $A = \{k, y, r, a, n\}$

► $B = \{m, o, r, l, e, y\}$

► $C = \{w, i, l\}$

Definition: The *union* of sets X and Y , $X \cup Y$, consists of every element that is in either X or Y . In other words, $z \in X \cup Y$ means $z \in X$ OR $z \in Y$.

Example: $A \cup B = \{k, y, r, a, n, m, o, l, e\}$.

Operations on sets: Intersection

- ▶ $A = \{k, y, r, a, n\}$
- ▶ $B = \{m, o, r, l, e, y\}$
- ▶ $C = \{w, i, l\}$

Definition: The *intersection* of sets X and Y , $X \cap Y$, consists of every element that is in both X and Y . In other words, $z \in X \cap Y$ means $z \in X$ AND $z \in Y$.

Example: $B \cap C = \{l\}$.

Operations on sets: Set difference

► $A = \{k, y, r, a, n\}$

► $B = \{m, o, r, l, e, y\}$

► $C = \{w, i, l\}$

Definition: The *set difference* of sets X and Y , $X - Y$, consists of every element that is in X but not in Y . In other words, $z \in X - Y$ means $z \in X$ AND $z \notin Y$.

Example: $C - A = \{w, i, l\}$.

Example: $A - B = \{k, a, n\}$.

Operations on sets: Symmetric difference

► $A = \{k, y, r, a, n\}$

► $B = \{m, o, r, l, e, y\}$

► $C = \{w, i, l\}$

Definition: The *symmetric difference* of sets X and Y , $X \triangle Y$, consists of every element that is in X but not in Y or in Y but not X . In other words, $z \in X \triangle Y$ means $z \in X$ AND $z \notin Y$ OR $z \in Y$ AND $z \notin X$. That is, $z \in X \text{ XOR } z \in Y$.

Example: $C \triangle A = \{k, y, r, a, n, w, i, l\}$.

Example: $A \triangle B = \{k, a, n, m, o, l, e\}$.

Operations on sets: Complement

► $A = \{k, y, r, a, n\}$

► $B = \{m, o, r, l, e, y\}$

► $C = \{w, i, l\}$

Definition: The *complement* of a set X , $\overline{X}$, is defined with respect to some universe of possible elements U . It consists of every possible element that is not in X . In other words, $\overline{X} ::= U - X$.

Example: If U is the universe of all letters in English, $\overline{A} = \{b, c, d, e, f, g, h, i, j, l, m, o, p, q, s, t, u, v, w, x, z\}$.

Example: If $U = \mathbb{Z}$, $\mathbb{Z}^- = \overline{\mathbb{Z}^+} - \{0\}$.

Disjoint sets

Definition: Sets A and B are *disjoint* if they have no elements in common.

$$A \cap B = \emptyset \text{ or}$$

$$A \subseteq \overline{B}.$$

Operations on sets: Power set

- ▶ $A = \{k, y, r, a, n\}$
- ▶ $B = \{m, o, r, l, e, y\}$
- ▶ $C = \{w, i, l\}$

Definition: The *power set* of a set X , $\mathcal{P}(X)$, is the set of all subsets of X . In other words, $\forall x \in \mathcal{P}(X), x \subseteq X$ and $\forall x \subseteq X, x \in \mathcal{P}(X)$.

Example: If $D = A \cap B = \{r, y\}$, $\mathcal{P}(D) = \{\{\}, \{r\}, \{y\}, \{r, y\}\}$.

Example: $\mathcal{P}(C) = \{\{\}, \{w\}, \{i\}, \{l\}, \{w, i\}, \{w, l\}, \{i, l\}, \{w, i, l\}\}$.

Example: $\mathcal{P}(\emptyset) = \{\emptyset\}$.

Operations on sets: Cardinality

► $A = \{k, y, r, a, n\}$

► $B = \{m, o, r, l, e, y\}$

► $C = \{w, i, l\}$

Definition: The *cardinality* of a set X , $|X|$, is the count of the number of (unique) elements in X .

Example: $|A| = 5, |B| = 6, |C| = 3$.

Example: $|\emptyset| = 0$.

Example: If $|A| = n$, $|\mathcal{P}(A)| = 2^n$. Each subset consists of a decision of whether to include or not include (2 possibilities) each of the n elements of A .

Building sets with predicates

General form: $\{ \text{description of a set} \mid \text{filter on the set} \}$.

Examples:

- ▶ $A ::= \{n \in \mathbb{N} \mid n = 2k + 1 \text{ for some integer } k\}$
- ▶ $B ::= \{x \in \mathbb{R} \mid x^2 > 1\}$

Note: Python has a notation for this idea.

Proving set equalities: Logic

$A = B$ means that, for all x , $x \in A$ IFF $x \in B$. We can use this definition to prove various set equalities. Here's a useful one.

Theorem: $A = B$ if and only if both $A \subseteq B$ and $B \subseteq A$.

$$A = B$$

$$\text{IFF } \forall x, x \in A \text{ IFF } x \in B$$

$$\text{IFF } \forall x, x \in A \text{ IMPLIES } x \in B \text{ AND } \forall x, x \in B \text{ IMPLIES } x \in A$$

$$\text{IFF } \forall x \in A, x \in B \text{ AND } \forall x \in B, x \in A$$

$$\text{IFF } A \subseteq B \text{ AND } B \subseteq A.$$

Proving set equalities: set-element method

We can use the previous result to prove other set equalities.

Theorem: For any sets A and B of elements in universe U ,
 $\overline{A \cap B} = \overline{A} \cup \overline{B}$.

DeMorgan's Law again! Now, connects intersection and union instead of AND and OR.

An object $x \in \overline{A \cap B}$ if it is *not* in both A and B . Such an element must either not be in A or not be in B . It follows that such an element must be in $\overline{A} \cup \overline{B}$. Thus, we have $\overline{A \cap B} \subseteq \overline{A} \cup \overline{B}$.

Note also that an object $x \in \overline{A} \cup \overline{B}$ if it is either not in A or it is not in B . Such an element can't be in both A and B , therefore. Said another way, it must be in $\overline{A \cap B}$. Thus, we have $\overline{A} \cup \overline{B} \subseteq \overline{A \cap B}$. Since both $\overline{A \cap B} \subseteq \overline{A} \cup \overline{B}$ and $\overline{A} \cup \overline{B} \subseteq \overline{A \cap B}$ are true, we know $\overline{A \cap B} = \overline{A} \cup \overline{B}$.

Venn diagram translation

$$(C - A) \cup B$$

$$(C - A - B) \cup (C \cap B - A) \cup (A \cap B \cap C) \cup (A \cap B - C) \cup (B - A - C)$$
